Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PS Claim 22; Page 166-170; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT   Method of controlling cell cycle progression - uses purified
PT   retinoblastoma protein or fragment, for use in combination with
PT   therapeutic methods to arrest tumorigenesis
PS   Disclosure; Fig 9; 68pp; English.
CC   The sequence is that of the retinoblastoma gene which encodes the
CC   retinoblastoma (RB) protein which may be used as part of a method of
CC   controlling cell cycle progression which may be used in combination
CC   with therapeutic methods to arrest tumourigenesis in organisms. The
CC   cell cycle can be reversibly arrested in a convenient and safe
CC   manner. The protein is used in a compsn. is relatively inexpensive
CC   and readily obtainable, and shows little or no toxic effects on
CC   healthy cells. It is also compatible with other methods and devices
CC   for regulating certain physiological processes of the body, such as
CC   blood cell prodn. and gamete prodn. Fragments of the protein are
CC   soluble in low concns of glycerol thus enhancing their value in
CC   pharmaceutical applicns.

PT Retinoblastoma suppressor protein with N-terminal modification -

PT inhibiting cellular proliferation, particularly cancer
PS Disclosure; Page 121-126; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PS Claim 22; Page 142-147; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT   New tetracycline responsive expression vectors - used for the
PT   tightly controlled expression of genes, such as tumour suppressor
PT   genes for treating cancers
PS   Disclosure; Pages 145-150; 190pp; English.
CC   The present sequence appears in the specification, which describes a
CC   tetracycline responsive expression vector (TREV), which contains a
CC   sequence encoding a fusion protein comprising a transcriptional
CC   transactivation domain (TTD) operatively attached to a tetracycline
CC   repressor protein (TRP), the first sequence operatively positioned
CC   downstream of a promoter. The vector also contains a cloning site
CC   operatively positioned downstream of a basal promoter comprising a
CC   tetracycline operator. The TREVs can be used to produce stable cell
CC   lines in which gene expression is tightly regulated by tetracycline.
CC   They can be used for the production of proteins such as tumour
CC   suppressor proteins which can be used for treating diseases characterised
CC   by abnormal cellular proliferation, particularly cancers.

PT   New fusion polypeptide of, e.g. transcription factor - used to
PT   treat, e.g. hyper-proliferative disease such as cancer and
PT   restenosis
PS   Example 1; Fig 2A; 91pp; English.
CC   This nucleotide sequence includes a coding region for retinoblastoma
CC   protein RB (see W62465). A new claimed polypeptide is a fusion of:
CC   (i) a transcription factor (TF) comprising a DNA binding domain,
CC   and (ii) a retinoblastoma (Rb) polypeptide that includes a growth
CC   suppression domain. Also new are: (1) a nucleic acid encoding the
CC   fusion protein, and (2) expression vectors containing such DNA.
CC   The fusion protein, particularly expressed from gene therapy
CC   vectors (especially adenovirus vectors), is used to treat
CC   hyperproliferative conditions, specifically cancer (particularly of
CC   the bladder) or restenosis (after angioplasty), but also diabetic
CC   retinopathy, thyroid hyperplasia, Grave's disease, psoriasis,
CC   benign prostatic hypertrophy, Li-Fraumeni syndrome and peripheral
CC   vascular disease. Tissue-specific expression of E2F-RB fusions is
CC   provided. The fusion proteins are more effective in repressing
CC   transcription of the E2F promoter than Rb alone and cause cell-cycle
CC   arrest in a variety of cells.

PT Inhibition of cancer cell proliferation - with retinoblastoma
PT protein or polypeptide
PS Example 1; Fig 2A-K; 72pp; English.
CC The present sequence encodes a human retinoblastoma (RB) protein
CC designated ppRB-110 or p110-RB. The protein is used in a method
CC for inhibiting proliferation of pathologically proliferating cells
CC lacking endogenous functional retinoblastoma protein. The method
CC comprises contacting the cells with a polypeptide comprising a 56 kD
CC C-terminal fragment of retinoblastoma protein. The method is useful
CC for treating cancers, especially retinoblastoma or secondary
CC osteosarcoma, breast cancer, small-cell lung cancer or fibrosarcoma.

PT   Broad spectrum tumour suppressor gene - by using retinoblastoma
PT   gene product p94RB to suppress abnormal cell proliferation in the
PT   treatment of cancer
PS   Claim 4; Fig 1; 115pp; English.
CC   Q72690 is the fragment of p94RB (a broad-spectrum tumour suppressor
CC   gene) which encodes the 94kD therapeutic retinoblastoma protein
CC   R63564. Expression of this protein in an abnormally proliferating
CC   cell causes that cell to enter a senescent-like state, terminating
CC   the proliferation. R63564 also has the advantage of engendering a low
CC   incidence of tumour suppressor gene resistance in a population of
CC   treated cells.

PS   Claim 22; Page 188-192; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT New tetracycline responsive expression vectors - used for the
PT tightly controlled expression of genes, such as tumour suppressor
PT genes for treating cancers
PS Disclosure; Pages 153-157; 190pp; English.
CC The present sequence appears in the specification, which describes a
CC tetracycline responsive expression vector (TREV), which contains a
CC sequence encoding a fusion protein comprising a transcriptional
CC transactivation domain (TTD) operatively attached to a tetracycline
CC repressor protein (TRP), the first sequence operatively positioned
CC downstream of a promoter. The vector also contains a cloning site
CC operatively positioned downstream of a basal promoter comprising a
CC tetracycline operator. The TREVs can be used to produce stable cell
CC lines in which gene expression is tightly regulated by tetracycline.
CC They can be used for the production of proteins such as tumour
CC suppressor proteins which can be used for treating diseases characterised
CC by abnormal cellular proliferation, particularly cancers.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                      library is a subtracted library derived from the UI-R-A0
                      library. The UI-R-A0 library  consisted of a mixture of
                      individually tagged normalized libraries constructed from
                      rat placenta, adult lung, brain, liver, kidney, heart,
                      spleen, ovary, and muscle. The tag is a string of 3-5
                      nucleotides present between the Not I site and the
                      oligo-dT track which allows identification of the library
                      of origin of a clone within the mixture. The subtracted
                      library (UI-R-A1) was constructed as follows: PCR
                      amplified cDNA inserts from a pool of approximately 3,840
                      UI-R-A0 clones from which 3' ESTs had been derived was
                      used as a driver in a hybridization with the UI-R-A0
                      library in the form of single-stranded circles. The
                      remaining single-stranded circles (subtracted library) was
                      purified by hydroxyapatite column chromatography,
                      converted to double-stranded circles and electroporated
                      into DH10B bacteria (Life Technologies) to generate the
                      UI-R-A1 library. This procedure has been previously
                      described (Bonaldo, Lennon and Soares, Genome Research 6:
                      791-806, 1996)"

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT   Method of controlling cell cycle progression - uses purified
PT   retinoblastoma protein or fragment, for use in combination with
PT   therapeutic methods to arrest tumorigenesis
PS   Disclosure; Fig 9; 68pp; English.
CC   The sequence is that of the retinoblastoma gene which encodes the
CC   retinoblastoma (RB) protein which may be used as part of a method of
CC   controlling cell cycle progression which may be used in combination
CC   with therapeutic methods to arrest tumourigenesis in organisms. The
CC   cell cycle can be reversibly arrested in a convenient and safe
CC   manner. The protein is used in a compsn. is relatively inexpensive
CC   and readily obtainable, and shows little or no toxic effects on
CC   healthy cells. It is also compatible with other methods and devices
CC   for regulating certain physiological processes of the body, such as
CC   blood cell prodn. and gamete prodn. Fragments of the protein are
CC   soluble in low concns. of glycerol thus enhancing their value in
CC   pharmaceutical applicns.

PT   Broad spectrum tumour suppressor gene - by using retinoblastoma
PT   gene product p94RB to suppress abnormal cell proliferation in the
PT   treatment of cancer
PS   Claim 4; Fig 1; 115pp; English.
CC   Q72690 is the fragment of p94RB (a broad-spectrum tumour suppressor
CC   gene) which encodes the 94kD therapeutic retinoblastoma protein
CC   R63564. Expression of this protein in an abnormally proliferating
CC   cell causes that cell to enter a senescent-like state, terminating
CC   the proliferation. R63564 also has the advantage of engendering a low
CC   incidence of tumour suppressor gene resistance in a population of
CC   treated cells.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Disclosure; Page 121-126; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT Retinoblastoma suppressor protein with N-terminal modification -
PT inhibiting cellular proliferation, particularly cancer
PS Claim 22; Page 142-147; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 158-162; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT New fusion polypeptide of, e.g. transcription factor - used to
PT treat, e.g. hyper-proliferative disease such as cancer and
PT restenosis
PS Example 1; Fig 2A; 91pp; English.
CC This nucleotide sequence includes a coding region for retinoblastoma
CC protein RB (see W62465). A new claimed polypeptide is a fusion of:
CC (i) a transcription factor (TF) comprising a DNA binding domain,
CC and (ii) a retinoblastoma (Rb) polypeptide that includes a growth
CC suppression domain. Also new are: (1) a nucleic acid encoding the
CC fusion protein, and (2) expression vectors containing such DNA.
CC The fusion protein, particularly expressed from gene therapy
CC vectors (especially adenovirus vectors), is used to treat
CC hyperproliferative conditions, specifically cancer (particularly of
CC the bladder) or restenosis (after angioplasty), but also diabetic
CC retinopathy, thyroid hyperplasia, Grave's disease, psoriasis,
CC benign prostatic hypertrophy, Li-Fraumeni syndrome and peripheral

```
CC   vascular disease.  Tissue-specific expression of E2F-RB fusions is
CC   provided.  The fusion proteins are more effective in repressing
CC   transcription of the E2F promoter than Rb alone and cause cell-cycle
CC   arrest in a variety of cells.

LOCUS       HUMRBSA      2994 bp    mRNA            PRI       12-JUL-1995
DEFINITION  Human retinoblastoma susceptibility protein mRNA, complete cds.
ACCESSION   M28419
VERSION     M28419.1  GI:190962
KEYWORDS    retinoblastoma protein; retinoblastoma susceptibility protein.
SOURCE      Homo sapiens retinoblastoma cDNA to mRNA.
  ORGANISM  Homo sapiens
            Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Mammalia;
            Eutheria; Primates; Catarrhini; Hominidae; Homo.

LOCUS       HUMRBA1RA    4600 bp    mRNA            PRI       12-JUL-1995
DEFINITION  Human retinoblastoma associated (RB1) mRNA, complete cds.
ACCESSION   M33647 J02994
VERSION     M33647.1  GI:190945
KEYWORDS    retinoblastoma protein.
SOURCE      Homo sapiens (clone: p4.7R) cDNA to mRNA.
  ORGANISM  Homo sapiens
            Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Mammalia;
            Eutheria; Primates; Catarrhini; Hominidae; Homo.

  TITLE     Molecular mechanism of retinoblastoma gene inactivation in
            retinoblastoma cell line Y79
  JOURNAL   Proc. Natl. Acad. Sci. U.S.A. 85 (16), 6017-6021 (1988)
  MEDLINE   88320373
COMMENT     Draft entry and computer-readable sequence for [1] kindly provided
            by E.Y.-H.P.Lee, 15-JUL-1988 The deletion spans exons 2-6 of the
            normal gene.

                      polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-A1
                      library is a subtracted library derived from the UI-R-A0
                      library. The UI-R-A0 library  consisted of a mixture of
                      individually tagged normalized libraries constructed from
                      rat placenta, adult lung, brain, liver, kidney, heart,
                      spleen, ovary, and muscle. The tag is a string of 3-5
                      nucleotides present between the Not I site and the
                      oligo-dT track which allows identification of the library
                      of origin of a clone within the mixture. The subtracted
                      library (UI-R-A1) was constructed as follows: PCR
                      amplified cDNA inserts from a pool of approximately 3,840
                      UI-R-A0 clones from which 3' ESTs had been derived was
                      used as a driver in a hybridization with the UI-R-A0
                      library in the form of single-stranded circles. The
                      remaining single-stranded circles (subtracted library) was
                      purified by hydroxyapatite column chromatography,
                      converted to double-stranded circles and electroporated
                      into DH10B bacteria (Life Technologies) to generate the
                      UI-R-A1 library. This procedure has been previously
                      described (Bonaldo, Lennon and Soares, Genome Research 6:
                      791-806, 1996)"

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

HUMRBA1RA
LOCUS       HUMRBA1RA    4600 bp    mRNA            PRI       12-JUL-1995
DEFINITION  Human retinoblastoma associated (RB1) mRNA, complete cds.
ACCESSION   M33647 J02994
VERSION     M33647.1  GI:190945
KEYWORDS    retinoblastoma protein.
SOURCE      Homo sapiens (clone: p4.7R) cDNA to mRNA.
  ORGANISM  Homo sapiens
            Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Mammalia;
            Eutheria; Primates; Catarrhini; Hominidae; Homo.
